

# Workshop 1: Introduction to UNIX command-line

## Day 2

Serghei Mangul, PhD | [smangul@ucla.edu](mailto:smangul@ucla.edu)  
QCB Fellow

Swiss Army knife" set of tools

# Day 1

---

**pwd** - report your current directory

---

**cd <to where>** - change your current directory

---

**ls <directory>** -list contents of directory

---

**cp <old file> <new file>** - copy file

---

**cp -r <old dir> <new dir>** - copy a directory and its contents

---

**mv <old file/dir> <new file/dir>** - move (or rename)

---

**rm <file>** -delete a file

---

**rm -r <dir>** - remove a directory and its contents

---

**mkdir <new directory name>** -make a directory

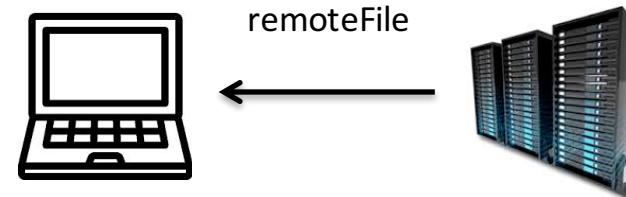

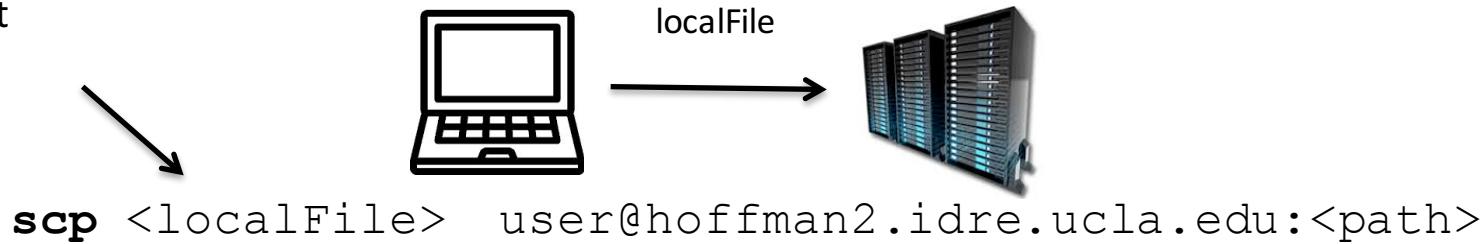

# Workshop Materials

- Workshop materials are on the workshop page
  - <https://qcb.ucla.edu/collaboratory/workshops/introtounix/>
- Please download **workshop.materials.zip** on your laptop
- Copy the w1-files.zip to hoffman2 using scp (Mac OS) or winscp (Windows)

# Remote copying : scp

File located on  
the laptop, in  
the current  
directory

**scp user@hoffman2.idre.ucla.edu:<path>/<remoteFile> ./**

Run scp from the local session of the terminal. To open a local session :

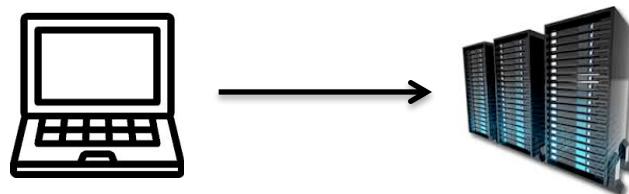

- Control-T to open a new tab
- New tab by default corresponds to a local session

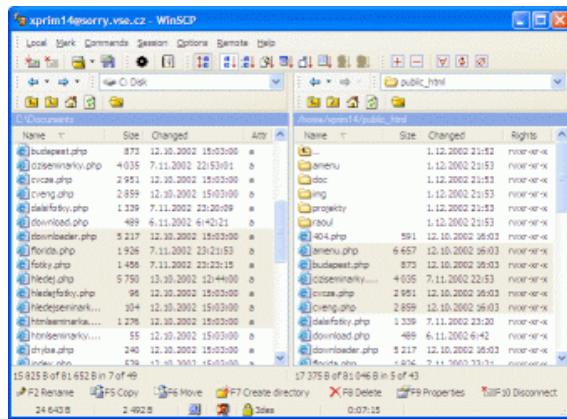

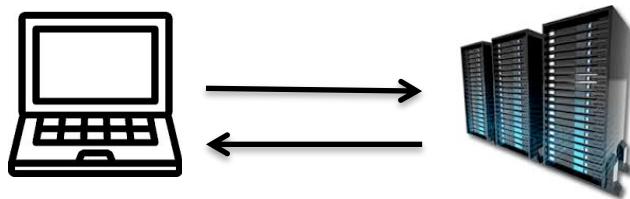

File located on  
the cluster, in  
<path>  
directory

# Copy the working files

- [Sergheis-MacBook-Air] \$ scp  
workshop.materials.zip  
serghei@hoffman2.idre.ucla.edu:~
- serghei@hoffman2.idre.ucla.edu's password:

Winscp

# Alias

- Go to home directory : cd
- Open file .bash\_profile: vi .bash\_profile
- Add in the end of the file:
- alias hoffman2='ssh serghei@hoffman2.idre.ucla.edu'
- Restart the session

Run from the local session of the terminal. To open a local session : **Control-T**

# Relative vs. absolute path

- A file or a directory can be referred to by
  - Relative path
    - `../test.txt` **if you are at**  
`/u/home/s/serghei/test/new/`
  - Absolute path
    - `/u/home/s/serghei/test/test.txt`

```
[serghei@login2 test]$ less test.txt  
[serghei@login2 test]$ ls -l ../  
[serghei@login2 test]$ ls -l ~/
```

Absolute

**245 Highland Ave, Manhattan  
Beach, California 90266**

Relative

# File permissions

- Each file in Unix has an associated permission level
- This allows the user to prevent others from reading/writing/executing their files or directories
- Use “`ls -l filename`” to find the permission level of that file
- There are 3 kinds of people in the world: **you** (user), **your friends** (group) and **the world** (others).

# Permission levels

- “**r**” means “read only” permission
- “**w**” means “write” permission
- “**x**” means “execute” permission
  - In case of directory, “**x**” grants permission to list directory contents

# File Permissions

```
-rw-r--r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
-rw-r--r-- 1 serghei eeskin   263 Mar 11 15:18 new.tar
-rw-r--r-- 1 serghei eeskin   13 Mar 11 15:27 test.txt
drwxr-xr-x 2 serghei eeskin 4096 Mar 11 15:36
dfgdfgdfgdfgdfgdfgdfgdf
```

Type

User (you)

# File Permissions

```
-rw-r--r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
-rw-r--r-- 1 serghei eeskin   263 Mar 11 15:18 new.tar
-rw-r--r-- 1 serghei eeskin   13 Mar 11 15:27 test.txt
drwxr-xr-x 2 serghei eeskin 4096 Mar 11 15:36
dfgdfgdfgdfgdfgdfgdfgdf
```

Type

Group

```
-rw-r--r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
```

# File Permissions (ls -l)

```
-rw-r--r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
-rw-r--r-- 1 serghei eeskin   263 Mar 11 15:18 new.tar
-rw-r--r-- 1 serghei eeskin   13 Mar 11 15:27 test.txt
drwxr-xr-x 2 serghei eeskin 4096 Mar 11 15:36
dfgdfgdfgdfgdfgdfgdfgdf
```

Type

“The World”

# Command: chmod

- If you own the file, you can change it's permissions with “chmod”

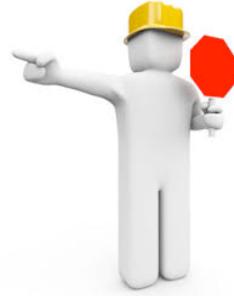

- Syntax:

```
chmod [user/group/others/all]+-[permission] [file(s)]
```

```
[serghei@login2 test]$ ls -l
drwxr-xr-x 3 serghei eeskin 4096 Mar 11 15:23 archive
-rw-r--r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
-rw-r--r-- 1 serghei eeskin   263 Mar 11 15:18 new.tar
-rw-r--r-- 1 serghei eeskin    13 Mar 11 15:27 test.txt
[serghei@login2 test]$ chmod g+w large.txt
[serghei@login2 test]$ ls -l
drwxr-xr-x 3 serghei eeskin 4096 Mar 11 15:23 archive
-rw-rw-r-- 1 serghei eeskin    72 Mar 11 14:22 large.txt
-rw-r--r-- 1 serghei eeskin   263 Mar 11 15:18 new.tar
-rw-r--r-- 1 serghei eeskin    13 Mar 11 15:27 test.txt
```

# Redirection

- program\_a
  - display program\_a's output at the terminal
- program\_a > file.txt
  - program\_a's output is written to file.txt
  - “>” will **overwrite** any existing data in file.txt
- program\_a < input.txt
  - program\_a gets its input from a file called “input.txt”
- program\_a >> file.txt
  - program\_a's output is **appended** to the end of file.txt

# Pipeline

pipe character

- `program_a | program_b`
  - `program_a`'s output becomes `program_b`'s input
  - Analogous to
    - `program_a > temp.txt`
    - `program_b < temp.txt`

# Command: wc

- To count the characters, words, and lines in a file use **wc**

```
wc <filename>
```

- The first column in the output is lines, the second is words, and the last is characters
- l** to count the lines

#lines	#words	#characters
30	30	72

large.txt

# Let's practice!

```
[serghei@login2 ~] $ wc test.log
```

```
1 3 15 test.log
```

```
[serghei@login2 ~] $ wc -l test.log
```

```
1 test.log
```

```
[serghei@login2 ~] $ ls | wc -l
```

```
5
```

# Command : cat

- Concatenate files together and displayed in the terminal.

```
cat <file1> <file2> ...
```

```
[serghei@login2 test]$ cat large.txt test.log | wc -l  
21  
[serghei@login2 test]$ cat large.txt test.log >all.txt
```

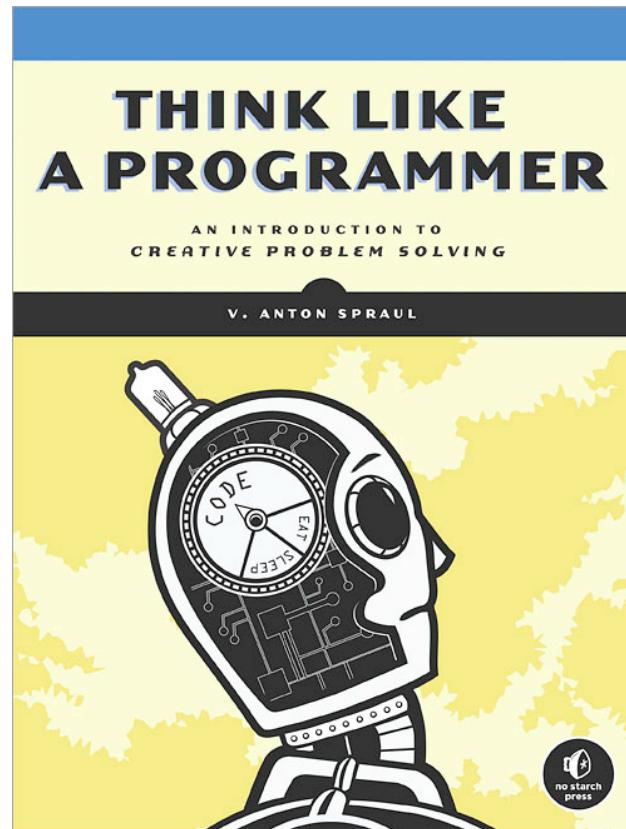

Directory

# Find

- find **new** -name **test.txt** -type f –print

File

# Tools for processing text files

# Command : grep

- allows to search one file or multiple files for lines that contain a certain string
- **grep** options
  - lines not containing the selected string ([-v](#))
  - line numbers where the string occurs ([-n](#))
  - number of lines containing the string ([-c](#))
  - filenames where the string occurs ([-l](#))
  - makes the match case-insensitive ([-i](#))

Grep syntax treats the first argument as the pattern and the rest as filenames

# Let's practice!

```
[serghei@login4 test]$ grep "1" large.txt
```

```
1
```

```
10
```

```
...
```

```
19
```

```
[serghei@login4 test]$ grep -n "1" large.txt
```

```
1:1
```

```
10:10
```

```
...
```

```
19:19
```

```
[serghei@login4 test]$ grep -c "1" large.txt
```

```
13
```

```
[serghei@login4 test]$ grep -l "1" large.txt test.txt
```

```
large.txt
```

```
[serghei@login4 test]$ grep "1" large.txt test.txt
```

```
large.txt:1
```

```
large.txt:10
```

```
...
```

Alternative?

Grep syntax treats the first argument as the pattern and the rest as filenames

# Lines corresponding to chr2

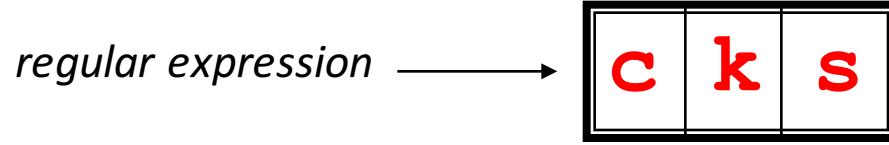

```
[serghei@login4 test]$ grep "chr2" hg19.gtf > chr2.txt
[serghei@login4 test]$ tail -n 1 chr2.txt
chr21 hg19_knownGene CDS 33066517 33066602 0.000000
    gene_id "uc002YPD.2"; transcript_id "uc002YPD.2";
```

# Regular Expression

Regular Expression  
/h[a4@](((c<)((k)(\|<))|((k)(\|<)|(x))s+\`  
|(d)|((t\|+|h))|3ea4@)|s+p[1]|a4@|n|3e|(t\|+)|/i  
©2006 FTS Conventions - www.fscconventions.com

- A **regular expression** is a string that can be used to describe several sequences of characters.

UNIX Tools rocks.

match

---

UNIX Tools sucks.

match

---

UNIX Tools is okay.

*no match*

# Regular Expressions

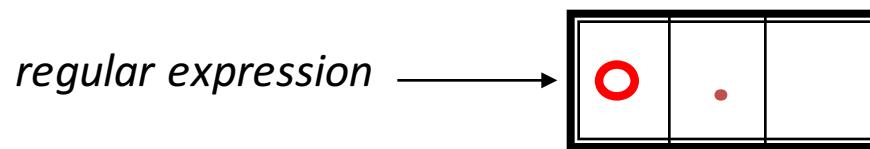

- A regular expression can match a string in more than one place.

Scrabble from the apple.

# Regular Expressions

- The `.` regular expression can be used to match any character.

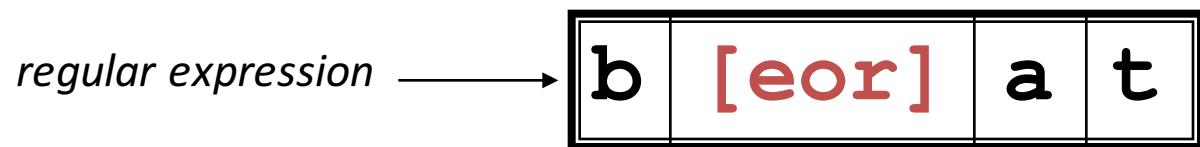

For me to poop on.

*match 1*                    *match 2*

The word "For" is at the beginning of the sentence. The word "me" is followed by a dotted box labeled "match 1". The word "to" is followed by the word "poop", which is enclosed in a dotted box labeled "match 2". The word "on" is followed by a period. Arrows point from the labels "match 1" and "match 2" to their respective dotted boxes.

# Character Classes

- Character classes [] can be used to match any specific set of characters.

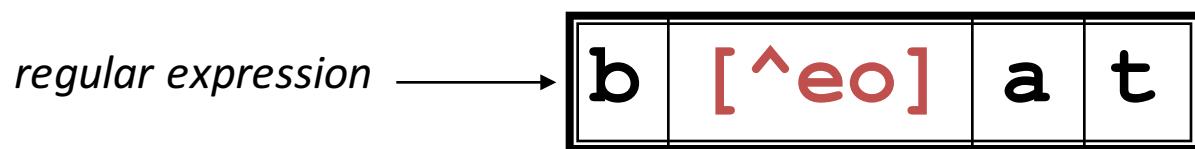

beat a brat on a boat

match 1                    match 2                    match 3

# Negated Character Classes

- Character classes can be negated with the **[^]** syntax.

beat a **brat** on a boat

↑  
*match*

# Let's practice!

```
[serghei@login4 test]$ grep "b[eor]at" regex.txt
[serghei@login4 test]$ grep "b.at" regex.txt
[serghei@login4 test]$ grep "b[^eor]at" regex.txt
[serghei@login4 test]$ grep "b[^eor]" regex.txt
```

# More About Character Classes

- **[aeiou]** will match any of the characters **a, e, i, o, or u**
- **[kK]orn** will match **korn** or **Korn**
- Ranges can also be specified in character classes
  - **[1-9]** is the same as **[123456789]**
  - **[abcde]** is equivalent to **[a-e]**
  - You can also combine multiple ranges
    - **[abcde123456789]** is equivalent to **[a-e1-9]**
  - Note that the **-** character has a special meaning in a character class **but only** if it is used within a range, **[-123]** would match the characters **-**, **1**, **2**, or **3**

# Alphanumeric characters

- Alphabetic characters
  - [a-zA-Z]
  - **[[:alpha:]]**
- Digits
  - **[0-9]**
  - **[[:digit:]]**
- Alphanumeric characters
  - [a-zA-Z0-9]
  - **[[:alnum:]]**

# Anchors

- Anchors are used to match at the beginning or end of a line (or both).

^K means beginning of the line

\$ means end of the line

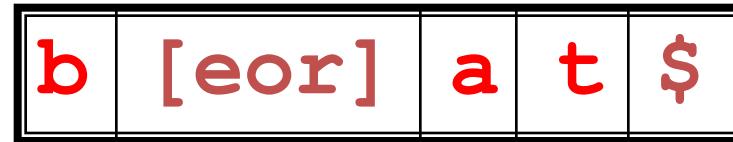

*regular expression*

**beat** a brat on a boat

*match*

*regular expression*

beat a brat on a **boat**

*match*

^word\$

^\$

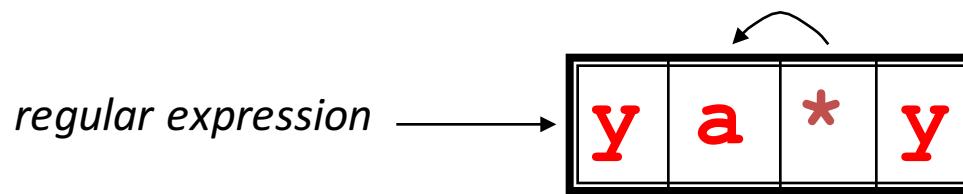

# Let's practice!

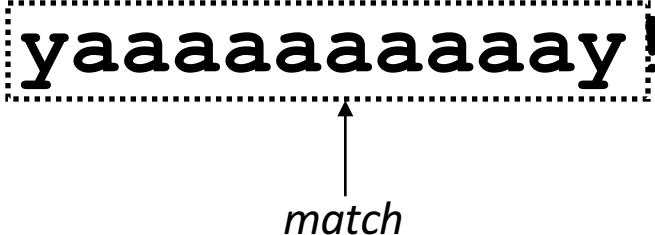

```
grep "[Aa]1" regex2.txt
grep "^[Aa]1" regex2.txt
grep "[Aa][0-9]\$" regex2.txt
grep "[0-9]" regex2.txt
grep "[[:alnum:]]" regex2.txt
grep "[[:alpha:]]" regex2.txt
```

# Repetition operators

- The \* (asterisk) matches the zero or more occurrences of the **preceding** character

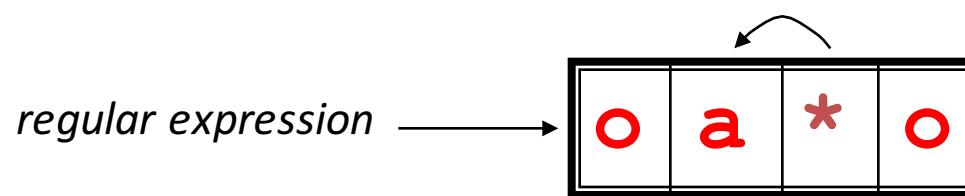

I got mail, **yaaaaaaaaay!**

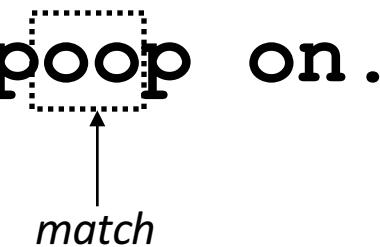

match

---

For me to **poop** on.

match

---

• \*

# Repetition operators

- \* Zero or more...
- ? Zero or one... (i.e. optional element)
- + One or more...
- E** {x} x instance of...
- {x,y} between x and y instances of...
- {x,} at least x instances of...
- r1|r2 regular expressions r1 or r2

grep -E <pattern> <filename>

# Special characters

- `\s` space
- `\t` tab
- `\s+` many spaces
- `\t\t` two adjacent tabs

# Let's practice!

```
grep -E "a1|b1" regex2.txt      Alternative  
grep "[ab]1" regex2.txt
```

# Lines corresponding to chr2

```
grep "chr2\s" hg19.gtf > chr2.gtf
```

# Repetition operators

- If you want to group part of an expression so that  $*$  or  $\{ \}$  applies to more than just the previous character, use  $( )$  notation
- Subexpressions are treated like a single character
  - $a^*$  matches 0 or more occurrences of  $a$
  - $abc^*$  matches  $ab$ ,  $abc$ ,  $abcc$ ,  $abccc$ , ...
  - $(abc)^*$  matches  $abc$ ,  $abcabc$ ,  $abcabcabc$ , ...
  - $(abc)\{2,3\}$  matches  $abcabc$  or  $abcababc$

# Let's practice!

```
grep -E "a+" regex2.txt
grep -E "a{3}" regex2.txt
grep -E "a{2,3}" regex2.txt
grep -E "a{2}" regex2.txt
grep -E "(abc)*" regex2.txt
grep -E "(abc)+" regex2.txt
grep -E "(abc){2}" regex2.txt
grep -E "[[:alpha:]]{3}" regex2.txt
grep -E "[[:alpha:]] [0-9]{2}" regex2.txt
grep -E "([:alpha:]][0-9)]{2}" regex2.txt
grep -E "[[:alpha:]][0-9]\sa" regex2.txt
```

?

- `grep -E "[0-9]{3}[\s\-\]{0,1}[0-9]{3}[\s\-\]{0,1}[0-9]{4}" f.txt`

# sed : a “stream editor”

- A non-interactive text editor
- Routine editing tasks
  - find, replace, delete, append, insert
- Input text flows through the program, is modified, and is directed to standard output.

```
sed [options] commands [file-to-edit]
```

# Why use sed?

- Sed is designed to be especially useful in three cases:
  - files are too large for interactive editing
  - editing is too complicated for regular text editors
  - multiple editing in one pass

# sed : Substitute command s

```
sed 's/old_word/new_word/' [file-to-edit]
```

To bee, or not to bee

```
sed 's/bee/be/' file_sed.txt
```

To be, or not to **bee**

# sed : g - Global replacement

- Normally, substitutions apply to only the first match in the string.

To **bee**, or not to bee  
be ↑ ? ↑

- To apply the substitution to **all** matches in the string use “**g**” options

```
sed 's/bee/be/g' file_sed.txt
```

# Edit matched text

- Put parentheses around the matched text:

```
sed 's/<pattern>/(&)/' annoying.txt
```

# Let's practice!

To bee, or not to bee

```
vi tobe.txt
```

```
sed 's/bee/be/' tobe.txt
```

To be, or not to bee

```
sed 's/bee/be/g' tobe.txt
```

To be, or not to be

```
sed 's/seven/nine/g' file_sed.txt | sed 's/nine/two/g'
```

```
sed 's/a/o/g' file_sed.txt
```

```
sed 's/^and/or/' file_sed.txt
```

```
sed 's/s...../xxxxx/g' file_sed.txt
```

```
sed 's/ago$/!/' file_sed.txt
```

```
sed 's/[12]/3/g' regex2.txt
```

```
sed 's/[:alpha:]/B/g' regex2.txt
```

```
sed -E 's/[:alnum:]{2}/(&)/g' regex2.txt
```

# Delete lines with sed

- Remove the 3rd line:
  - `sed '3d' fileName.txt`
- Remove the line containing the string "awk":
  - `sed '/awk/d' filename.txt`
- Remove the last line:
  - `sed '$d' filename.txt`

# Let's practice!

```
sed '3d' regex2.txt
sed '/a/d' regex2.txt
sed '/[0-9]/d' regex2.txt
sed '$d' regex2.txt
```
